Carboniferous Stratigraphy in the Vicinity of the Daniel Boone National Forest

Introduction

Carboniferous strata are of importance to the development of the Appalachian Basin. The Pennsylvania-Ordovician boundary is a major marker for the Carboniferous System. In the Appalachian Basin, the Pennsylvania-Ordovician boundary is marked by the presence of marine faunas in the Pennsylvania System. The boundary is also marked by a significant change in the composition of flowers. The Carboniferous system is divided into the Mississippian and Pennsylvanian Epochs. The Mississippian Epoch is characterized by the presence of marine faunas and the Pennsylvanian Epoch is characterized by the presence of continental faunas. The Carboniferous system is divided into the Mississippian and Pennsylvanian Epochs. The Mississippian Epoch is characterized by the presence of marine faunas and the Pennsylvanian Epoch is characterized by the presence of continental faunas.

Mississippian Epoch

The Mississippian Epoch is characterized by the presence of marine faunas. The Mississippian Epoch is divided into the Early, Middle, and Late Mississippian Periods. The Early Mississippian Period is characterized by the presence of marine faunas and the Late Mississippian Period is characterized by the presence of continental faunas. The Mississippian Epoch is divided into the Early, Middle, and Late Mississippian Periods. The Early Mississippian Period is characterized by the presence of marine faunas and the Late Mississippian Period is characterized by the presence of continental faunas.

Pennsylvanian Epoch

The Pennsylvanian Epoch is characterized by the presence of continental faunas. The Pennsylvanian Epoch is divided into the Early, Middle, and Late Pennsylvanian Periods. The Early Pennsylvanian Period is characterized by the presence of continental faunas and the Late Pennsylvanian Period is characterized by the presence of marine faunas. The Pennsylvanian Epoch is divided into the Early, Middle, and Late Pennsylvanian Periods. The Early Pennsylvanian Period is characterized by the presence of continental faunas and the Late Pennsylvanian Period is characterized by the presence of marine faunas.

Geologic Setting

The Daniel Boone National Forest is located in the eastern part of the United States. The forest is characterized by the presence of Carboniferous strata. The Carboniferous strata are characterized by the presence of marine faunas and the presence of continental faunas. The Carboniferous strata are divided into the Mississippian and Pennsylvanian Epochs. The Mississippian Epoch is characterized by the presence of marine faunas and the Pennsylvanian Epoch is characterized by the presence of continental faunas.
